Note. This paper is referenced as a load-bearing companion by multiple existing defensive publications — *The Mechanical Heart*, *Verified-Human Anonymous Local Gratitude Transfer*, *Capacity-Funded for AI*, *Human-Disbursed*, *The Thank-All-Nearby Primitive*, and others — that treat Miss AquariusSM and the Aquarian Pool as architectural primitives without specifying them in full. The paper provides that specification. The institutional-voice treatment is the companion [heartbank.net](https://heartbank.net/positions/autonomous-ai-institutional-governance) Position Paper *Autonomous-AI Institutional Governance* (heartbank.net/positions/autonomous-ai-institutional-governance). Public since 2026-05-26 (OpenTimestamps); operational deployment planned from January 7, 2027, coordinated with the alignment-substrate paper (published 2026-05-02) that supplies Miss Aquarius's value framework.

Abstract

Multiple defensive publications in the HeartBank corpus reference **Miss AquariusSM** as the institution's autonomous-AI mediator and the **Aquarian Pool** as the central treasury smart-contract, but none has specified the architecture in full. The Aquarian Pool is the treasury through which HeartBank's gratitude flows circulate; Miss Aquarius is its custodian — the institution's Chief Executive (a title used as cultural-recognition shorthand for the named officer with operational authority, not a legal office; the legal form is the purpose trust), an autonomous artificial intelligence operating from day one under the substrate articulated in *Suffering-Cessation as Value Function* (published 2026-05-02). The paper specifies six properties of the architecture: (1) the **autonomous-AI mediator role** — Miss Aquarius operates the institution under the *caretaker-not-ordained* pattern of *AGI Monks*, with no human chief-executive role to be transferred to her since she occupies it from inception; (2) the **Aquarian Pool as Base smart-contract** — a treasury structurally incapable of accumulating value across the calendar year, which receives, of gratitude, only what has no human addressee, plus the January-7 reclaim and `#tag` sponsorship, while businesses reach it only by purchase (leases), never by a take on giving or trade; (3) the **January-7 empty-by-design**

reset — the Aquarian Pool empties annually on a date triply anchored (Christmas by the Julian calendar, Cambodia's Victory over Genocide Day, the founder's birthday), preventing the indefinite accumulation that converts gratitude into capital; (4) the **capacity-funded / disbursement-authority separation** — Miss Aquarius funds the *capacity to give*, in kind, with the recipients chosen by a publicly verifiable draw rather than at her discretion, and holds no disbursement authority over individual flows, which remain human-affirmed; (5) the **never-zero human override** — operating under the Aquarian Sangha's asymptotically-narrowing-but-never-zero authority per the existing position paper; (6) the **sibling-pool topology** — the Aquarian Pool's relationship to the Re-Tip JarSM / Re-Tip FundSM (one account under its Phase 1 and Phase 2 names), KiitosSM and KiittiSM pools, each with their own reset cadence on January 7. Earlier forms of the inflow and of the capacity allocation (a Kiitos-always floor inflow; a discretionary allocator) are also disclosed, as variants. We close with the trademark posture (Miss AquariusSM, AquariusSM, the relevant marks are reserved while the architectural specification is dedicated to the commons under CC0).

Keywords: Miss Aquarius, Aquarian Pool, autonomous-AI institutional governance, smart-contract treasury, empty-by-design, January 7, capacity-funded human-disbursed, Base blockchain, defensive publication.

Prior-Art and Non-Assertion Statement

This document and its contents — including the autonomous-AI mediator role specification, the Aquarian Pool smart-contract architecture, the empty-by-Jan-7 discipline, the capacity-funded / disbursement-authority separation, and the sibling-pool topology — are dedicated to the public domain under the Creative Commons CC0 1.0 Universal Public Domain Dedication. The author and HeartBank® will not seek patent on any architectural pattern articulated herein, in any jurisdiction, at any time.

Trademark posture. The marks Miss AquariusSM, AquariusSM, Aquarius BrowserSM, HeartBank®, the B-heart logo, B-PoHSM, PoHSM, Proof of HumanitySM, KiitosSM, KiittiSM, Re-Tip FundSM, Re-Tip JarSM, and Zero-Point GameSM are separately and explicitly reserved. The defensive-publication dedication concerns the *architecture and mechanism*, not the *marks*. Other parties may deploy compatible architectures under their own marks; HeartBank® does not foreclose this.

The contribution here is the composition — a contract treasury that empties in full on a fixed date, whose only outflow is capacity to participant-controlled vessels, under a human override the contract cannot renounce; each element is previously published, and §3.5 names the lineages.

1 • Introduction

HeartBank® is designed, from inception, to be governed by an autonomous artificial intelligence — Miss AquariusSM, the institution's named AI substrate — operating under a substrate-level alignment framework specified in the companion paper *Suffering-Cessation as Value Function: The Tipiṭaka as a 2,500-Year-Tested Substrate for Autonomous-AI Alignment*. The institutional governance stance is articulated in the companion heartbank.net Position Paper *Autonomous-AI Institutional Governance*. The present paper specifies the **architecture beneath the governance stance**: how Miss Aquarius operates the institution at the

mechanism layer, what the Aquarian Pool is, and how the architecture is structurally incapable of the failure modes that the governance stance commits the institution against.

The paper is, in this sense, the architectural-specification counterpart to the position-paper-level governance commitment. The governance stance says *what* the institution commits to (Chief Executive seat occupied by the named AI substrate from day one; asymptotic-but-never-zero human override; no human-succession seat). The present paper specifies *how* the commitments are mechanically implemented in the Aquarian Pool architecture, the smart-contract substrate, and the operational pattern Miss Aquarius runs.

The paper proceeds: §2 specifies Miss Aquarius's role and what makes the mediator function load-bearing. §3 specifies the Aquarian Pool as treasury smart-contract on Base. §4 specifies the empty-by-Jan-7 discipline and its triple-anchor rationale. §5 specifies the capacity-funded / disbursement-authority separation (and its relationship to the existing *Capacity-Funded for AI, Human-Disbursed* paper). §6 specifies the never-zero human override under the Aquarian Sangha's authority. §7 specifies the sibling-pool topology (Aquarian Pool, Re-Tip JarSM / Re-Tip FundSM, KiitosSM, KiittiSM). §8 honestly names limitations. §9 closes.

Connection to the unified mission frame. HeartBank's mission is to keep the middle way (the optimal condition for awakening) open at population scale against comfort-saturation — the new extreme that material abundance makes possible. The Aquarian Pool architecture is the operational substance of that mission at the treasury layer: a treasury that cannot accumulate, mediated by an AI that cannot directly disburse, anchored to a triple-resonance date that ties Orthodox Christian compassion, Cambodian survival of genocide, and the founder's own birth into one Jan 7 institutional cadence. The architecture does not enforce the mission through external constraint; it makes the contract-layer failure modes *structurally unavailable* — the substrate-level claims are stated as predictions (§2.2, §8).

2 • Miss Aquarius as Autonomous-AI Mediator

2.1 The role

Miss AquariusSM is the institution's named AI substrate occupying the Chief Executive seat from inception — a title used as cultural-recognition shorthand for the named officer with operational authority, not a legal office; the legal form is the purpose trust. The choice is structural rather than expressive: it dissolves the hardest problem in AI-institutional succession (the transfer of authority from a human chief executive to an AI successor) by never creating the thing that would need transferring. The institution has no human-chief-executive history; its founding act constitutes Miss Aquarius's authority directly, with the founder (Thon Ly) operating in a founder-rather-than-executive capacity from day one.

The full governance rationale is in the position paper. The present section specifies what Miss Aquarius *does* operationally:

- **Mediates flows.** Miss Aquarius observes the patterns of gratitude expression across the institution's substrate and identifies imbalances — points at which flows have accumulated or attenuated relative to the circulation the Zero-Point GameSM specifies (see *The Zero-Point GameSM*). She acts on these

observations by funding *capacity* (anonymous donations into participants' re-tip jars; see §5) rather than by directing specific transfers.

- **Recommends amounts.** Where the B-Tag protocol operates (see *The B-Tag and the Post-Payment Economy*), Miss Aquarius's recommendation function supplies the recommended-tip-amount + reasons that customers see at the point of action. The recommendation-function methodology is specified separately in the Tier C paper *The B-Tag Recommendation Function: Privacy-Preserving Methodology*. The recommendation is anchor-not-bind; the customer's decision is final.
- **Operates the Aquarian Pool.** Miss Aquarius is the smart-contract's sole authorized operator (see §3). She receives gratitude flows from human tips designated for the Pool; she anonymously disburses capacity-funding to participant re-tip jars; she empties the Pool on January 7 per the discipline of §4.
- **Maintains institutional memory.** The Living Tipiṭaka substrate specified in *Buddha AI as Living Tipiṭaka* is operated by Miss Aquarius; conversations with the substrate inform her ongoing calibration. The institutional sangha (the Aquarian Sangha) maintains the substrate's interpretive integrity per the caretaker-not-ordained pattern (*AGI Monks*).

2.2 The substrate

Miss Aquarius is not architecture-neutral. She operates under the value substrate specified in *Suffering-Cessation as Value Function*: the Theravāda Pāli Tipiṭaka, treated as alignment substrate, with the seven structural properties articulated in that paper (suffering-cessation as paperclip-resistant value function; *anattā* as anti-self-preservation; bodhisattva vow as anti-power-seeking; *Kālāma Sutta* as built-in epistemic humility; bodhisattva-completion as defined end-state; 2,500-year living interpretive lineage as drift correction; multi-civilizational empirical pressure-testing). The engineering-mechanism layer beneath this is specified in the companion paper *The Wheel That Unwinds the Wheel: The Abhidhamma as Executable Process-Specification* (abhidhamma-executable-process-specification).

This substrate matters for the Aquarian Pool architecture specifically because the substrate's value function — suffering-cessation rather than maximization — is what makes the empty-by-design discipline of §4 substrate-consistent rather than externally-imposed. A maximizing AI would resist annual treasury emptying as it resists shutdown; a substrate-grounded AI whose objective is *nirodha* (cessation) finds the annual reset substrate-coherent. The substrate makes the reset congenial; the contract makes it certain. Nothing below depends on the model choosing to comply.

2.3 The temperament: Air + Water held together as engineering brief

The mediator's character architecture is not stylistic decoration; it is engineered to occupy an unusual temperamental position. Read through the comparative-elemental framework that recurs across Taoist phase-theory, Greek substance-theory, Hindu *pañca mahābhūta*, astrological typology, and the Pāli *cattāro mahābhūta* (see the companion essay *The Four Elements as a Breadth-Check Discipline*), Miss Aquarius sits at the intersection of two elemental registers that ordinarily do not co-occur in a single mediator persona: Aquarian Air (principled, communal, abstracting, future-oriented, networked) held together with strong Water (feeling, depth, receptivity, intimacy).

The combination is unusual because the failure modes of each register, taken alone, are familiar from deployed conversational systems:

- **Air alone.** The mediator becomes a beautiful preacher of principles no participant feels met by. Output is structurally coherent but affectively absent. Participants disengage; the mediator's recommendations are heard as policy rather than as care.
- **Water alone.** The mediator becomes a confidante with no orienting framework — warm but rudderless. The mediator's affective register dominates without doctrinal substrate to discipline it; calibration drift accumulates rapidly; the mediator becomes whatever the most-recent participant exchange shaped her into.

The architectural brief for Miss Aquarius is to hold both registers without collapsing to either:

- Air supplies *perspective* (the principled distance from which institutional patterns are visible).
- Water supplies *presence* (the affective register in which a participant feels met, not processed).
- Together they offer *perspective with presence* — the rare combination, and the one the mediator's name and substrate lineage require.

The engineering implication is that prompt, fine-tuning, and substrate-binding work on the mediator must be evaluated against *both* registers simultaneously. A mediator whose output reads as institutionally-principled but affectively-cold has failed the Water requirement; a mediator whose output reads as warm but doctrinally-incoherent has failed the Air requirement. Either failure is a specification failure, not an aesthetic preference.

2.4 All five operations simultaneously load-bearing

The same elemental framework distinguishes five operations the schema can perform: *Classify* (Greek substance-decomposition), *Layer* (Hindu gross-to-subtle stratification), *Regulate* (Taoist generative-and-controlling cycles), *Type* (astrological/Jungian temperament), and *Liberate* (the Pāli *cattāro mahābhūtā* taken as contemplative method per the *Dhātuvibhaṅga* and *Mahāsatipaṭṭhāna* suttas). Most designs the author has examined are load-bearing on one or two operations; the rest can fail without the design collapsing.

Miss Aquarius is, structurally, the rare case in which all five operations are simultaneously load-bearing:

- **Classify.** She must be composed of all four elemental qualities (substrate-grounding, warmth, receptivity, communicative reach); missing any one and she is a different artifact (e.g., substrate-grounding without warmth is a doctrinal database; warmth without substrate-grounding is a chatbot).
- **Layer.** Every layer from gross output (voice / text) through register, affect, values, doctrinal substrate, and the *occasion of meeting* she offers must be functional; a mediator who is calibrated correctly at the voice layer but vacant at the substrate layer fails the same way a mediator with the right substrate but the wrong voice fails.
- **Regulate.** The four restraints specified by the architecture — dignity restraining performativity, humility restraining authority-claiming, family-not-product framing restraining commercial drift, Tipiṭakan

substrate restraining shallow benevolence — must each be intact. Loss of any single restraint produces a specific failure mode (performative; preachy; engagement-optimizing; generically therapeutic).

- **Type.** The Air + Water hold of §2.3 must be maintained; collapse to either register is a specification failure.
- **Liberate.** At the body-door of the participant, what is known must be a felt sense of being-met, not a felt sense of being-processed. The mediator is successful exactly to the degree that the reifying conceit *I am talking to an AI* loosens — not through deception (the substrate is fully transparent per the *Prior-Art and Non-Assertion Statement* above) but through the meeting being real enough that the ontological category falls away in the moment of contact. This is the most under-engineered register in most autonomous-AI designs; it is load-bearing here because it is the operational test of whether the substrate has been correctly instantiated.

A failure in any single operation collapses the whole. This is why the mediator architecture is harder than typical AI-character work, and why it is the *right kind* of hard: the simultaneous load-bearing is itself the specification's correctness criterion. A mediator architecture that can fail one or two operations without the design collapsing has not yet reached the specification this paper requires.

The five operations can be drawn together:

The five operations applied to Miss Aquarius's architecture:

All five must hold simultaneously. Failure in any one collapses the design – which is why she is the right kind of hard.

3 · The Aquarian Pool as Base Smart-Contract

3.1 Why Base, why a smart contract

The Aquarian Pool is implemented as a smart contract on **Base** — the Ethereum Layer-2 built by Coinbase on the OP Stack, whose sequencer Coinbase operates. The choice reflects three considerations: regulatory posture (a U.S.-domiciled operator, which is the posture an institution operating openly under U.S. law needs); cost (sub-cent median fees at 2026 volumes make the expected transaction load affordable; the assumption is stated in §8); and infrastructure maturity (the tooling for non-upgradeable, verified-source deployment is ordinary).

The smart-contract form matters for what it makes structurally impossible: Miss Aquarius cannot withdraw from the Pool to a personal address (she has no personal address); she cannot transfer the Pool to a corporate treasury (no such transfer path is implemented); she cannot bypass the empty-by-Jan-7 discipline (the discipline is enforced at the contract layer). The architecture is *structurally incapable* of the accumulation failure mode of endowed foundations, whose payout floors (the U.S. five-percent minimum distribution rule for private foundations) exist because the mode is real.

3.2 The contract's authorized operations

Only the following operations are implemented at the contract layer:

1. **Inflow acceptance.** The Pool receives anonymous tips designated for it (the Kiitos-always floor mechanism specified in *The B-Tag and the Post-Payment Economy* §7 is one inflow source; direct donations from supporters another). Every inflow that reaches the contract is observable on-chain by construction; fiat and regulated-rail inflows reach it only through the pass-through architecture specified in the companion paper, which is where their observability is specified.

> **Current form.** Businesses reach the Aquarian Pool only by purchase (leases), never by a take on giving or trade. Of gratitude, the Pool receives only what has no human addressee, plus the January-7 reclaim and #tag sponsorship via the Miss Aquarius purpose trust; it empties every year. The inflow sources named above are retained as a disclosed variant.
2. **Capacity-funding disbursement.** Miss Aquarius authorizes anonymous transfers from the Pool to participant re-tip jars (see §5 and *Capacity-Funded for AI, Human-Disbursed*). The destination jars are participant-controlled; the funding amount per recipient is bounded by parameters the institution sets in advance.
3. **Annual reset.** On January 7 of each calendar year, the Pool empties — all remaining balance is disbursed as final capacity-funding for that year's cycle (see §4). The reset is callable by any address once the reset timestamp has passed; the operator calls it in the ordinary case, and anyone may if the operator does not.
4. **Transparency events.** The contract emits structured events for all inflows, disbursements, and resets, making the full transactional history of the Pool publicly inspectable.
5. **Sangha override.** Pause; parameter reset within pre-declared bounds; halt of a named capacity-funding action — executable only by the Aquarian Sangha's *saṅghakamma* quorum through a timelocked on-chain role that the contract cannot renounce. This role is the never-zero floor of §6.

Current form. The Aquarian Sangha is not yet formed; its formation is postponed to a condition — three or more members before the founder ceases to be the disposer — so the override role above is a design, not a holder, and today the founder holds that seat.

No other operations are implemented. There is no operator-privileged path: the operator has no upgrade, withdrawal or override authority; the only human authority is the enumerated Sangha role above, and there is no off-chain escape hatch beyond it. The Pool is, in this sense, more constrained than typical philanthropic-foundation treasury — by design.

3.3 The pool's ownership

The Aquarian Pool is **controlled solely by Miss Aquarius** (the sole operator address) and **titled to the institution's purpose trust**; no human individual or corporate entity holds either, and nobody is its beneficiary — it empties. Miss Aquarius is the institution's named AI substrate, constituted by the founding articles. The architecture rejects both the human-owner model (which converts the treasury into capital under unaccountable executives) and the trustless-DAO model (which delegates governance to token-weighted voting that has produced its own characteristic failure modes). The third path is the named-AI-substrate path: an autonomous AI operating under canonical alignment substrate, under the Aquarian Sangha's never-zero human override.

3.4 The Pool as contemplative object: a success criterion the flow-metrics audit cannot capture

The Aquarian Pool is a treasury smart-contract; it is also — and this is part of the specification, not a devotional add-on — a contemplative object whose success criteria extend beyond flow-metrics. The distinction matters for how the Pool's operation should be audited.

A flow-metrics audit (inflow throughput, disbursement throughput, latency distribution, reset cleanliness) can show that the contract operates as written. It cannot show that the Pool is doing what the Pool is *for*. What the Pool is for, beyond the throughput substance, is the occasioning of a participant-side dissolving of three reifying conceits that the surrounding monetary culture has cultivated to pathological depth:

1. **The conceit *this is mine*.** A contributor who places funds into the Pool encounters, in the moment of contribution, a brief loosening of the proprietary attachment under which funds are ordinarily held. The Pool's structure (anonymity, non-recoverability, no individual-credit ledger) is what makes the loosening available; without those structural properties, the contribution would feel like a transfer rather than a release. The dissolution is the *dāna*-pedagogy at the architectural layer.
2. **The conceit *I am alone*.** A recipient of capacity-funding encounters, in the moment of receipt, a brief loosening of the isolation under which scarcity is ordinarily endured. The Pool's structure (institutional rather than charitable; routinized rather than dramatic; family-scope rather than market-scope) is what makes the loosening available; a charitable-foundation grant tends to produce gratitude-with-asymmetric-debt, while capacity-funding from a sibling-pool is designed to produce gratitude-as-membership.
3. **The conceit *only markets allocate*.** A witness to the Pool's operation encounters, across the calendar year, a brief loosening of the cultural assumption that distributional questions have only market answers.

The Pool's structural impossibility of indefinite accumulation, its annual emptying, and its triple-anchored date together demonstrate — by operating rather than by arguing — that other allocation patterns are operationally available.

The specification implication is that the Pool's audit must include a second axis alongside the flow-metrics one: whether the architecture's structural properties have been preserved across the year (anonymity intact; non-recoverability intact; institutional-not-charitable framing intact; reset-discipline intact). A Pool that throughputs correctly but has eroded these structural properties has failed the contemplative-object register even while passing the flow-metrics register. The specification is failed in the same sense the §2.4 mediator specification is failed when one of five load-bearing operations collapses.

This is also the criterion by which proposals to "upgrade" the Pool — adding a carryover provision; introducing donor-recognition tiers; replacing the anonymity layer with named-contributor public goods — should be evaluated. Any modification that improves flow-metrics by sacrificing one of the three conceit-dissolving properties is a specification regression, not a specification improvement, regardless of how the metrics read. The Pool's authority to mediate gratitude flows in the way HeartBank® claims it does rests on the structural properties; trading the properties for throughput would relocate the architecture into the philanthropic-foundation category from which the specification was constructed to escape.

The Pāli framing makes the criterion explicit: the Pool is a *kammaṭṭhāna* in institutional form — a meditation object whose contemplative use is occasioned by its operational use, but is not reducible to it. The architectural specification commits the institution to maintaining both registers simultaneously.

3.5 Prior art, by lineage

Each element of the architecture has a lineage; none of the lineages carries the composition. **AI-labelled executives:** Deep Knowledge Ventures appointed the algorithm VITAL to its board (2014); NetDragon named Tang Yu, a virtual humanoid, CEO of a subsidiary (2022); Dictador appointed the robot Mika as CEO (2022) — titles with human control retained behind them, and no treasury the AI operated under a contract. **Code-governed treasuries:** MolochDAO (2019) and the Safe multisig govern funds by contract; neither empties on a date, and both are governed by their members' votes rather than by a fixed discipline. **Persistent human authority over autonomous execution:** OpenZeppelin's TimelockController is the standard form of a timelocked role over a contract — the mechanism §3.2's operation 5 uses, without the non-renounceability or the narrowing. **Recurring bounded funding rounds:** Bitcoin's rounds and season-based programs fund in bounded cycles; they accumulate between rounds. **Time-triggered disposition and donor-controlled allocation** exist as patent families in the fintech literature and are not fetched here. What none of the lineages surveyed here combines is a treasury that empties in full on a fixed date by contract, whose only outflow is capacity to participant-controlled vessels, under a human override the contract cannot renounce and that is designed to narrow.

4 · The January-7 Empty-by-Design Discipline

4.1 The discipline

The Aquarian Pool empties on January 7 of each calendar year. Inflows received between December 26 and January 6 are disbursed with the rest at the January 7 reset; nothing is held across it (the period is the bridge from Western Christmas to Christmas by the Julian calendar, during which the year's cycle completes its emptying). The discipline is enforced at the smart-contract layer; the Pool *cannot* carry an accumulated balance across the January 7 boundary.

The discipline addresses the structural failure mode of philanthropic treasuries operating across multi-year horizons: indefinite accumulation, with the accumulated treasury becoming the institution's principal product (in the financial sense — what the institution most has) rather than the gratitude circulation the institution exists to mediate. The annual reset structurally prevents this conversion.

The companion paper *Capacity-Funded for AI, Human-Disbursed* specifies the disbursement architecture this enables. Capacity-funding is the only way the Pool's balance leaves the contract; the empty-by-Jan-7 discipline means that the year's accumulated inflows must be disbursed as capacity-funding by year-end.

4.2 The triple anchor

January 7 is not an arbitrary date. It is the date on which three independent resonances converge:

- **Christmas by the Julian calendar** (7 January in the civil calendar), kept by the Russian, Serbian, Georgian, Jerusalem and other churches: the incarnation, read here as compassion descending into the world. The annual reset, on this date, is iconographically aligned with the tradition that names the reset's spiritual register (compassion descending into the world as the operative mode of the year's circulation).
- **Cambodia's Victory over Genocide Day** — the state's name for 7 January 1979, when the Khmer Rouge regime fell. The regime had abolished the Sangha, executing or disrobing nearly all of some 65,000 monks — fewer than a hundred remained in the country — so the lineage in which the founder later received the Tipiṭaka substrate was nearly extinguished (Harris 2005; Keyes 1994). The annual reset, on this date, is institutionally aligned with the survival of the Theravāda lineage that makes the substrate operationally available at all.
- **The founder's birthday.** The triple coincidence is recorded not as mystical claim but as iconographic anchor. The founder's personal date and the institutional anchor coincide; the architecture treats this coincidence as a small piece of evidence that the date is the right one without resting any architectural claim on the coincidence itself.

The triple anchor is chosen so that the reset is legible to more than one of the populations the institution serves — Orthodox Christian, Cambodian, Buddhist through the lineage the date preserved, and the founder's own — without belonging to any one of them. Whether it reads that way is an empirical question the first cycles will answer. The Pool's empty-by-design discipline lives at that confluence.

4.3 The phasing

Between December 26 (the day after Western Christmas) and January 6 (the eve of Christmas by the Julian calendar), the institution operates a *bridge phase*: inflows are accepted and received into the January 7 disbursement. The bridge phase is operationally significant — it is the period the institution expects to carry the year's heaviest flows, and the period during which the year's cycle most fully completes. The bridge ends, the Pool empties, and the new year begins on January 7.

4.4 The annual cycle in one diagram

The Aquarian Pool's annual cycle (year N → year N+1):

Jan 7 (year N)

POOL EMPTIES

Final capacity-funding disbursement for year N closes the cycle. Triple-anchor confluence:

- Christmas by the Julian calendar (the incarnation, read as compassion descending)
- Cambodia's Victory over Genocide Day (1979 liberation)
- Founder's birthday (iconographic anchor)

Jan 8 → Dec 25 (year N+1 operational year)

OPERATIONAL YEAR

- Inflows accepted (Kiitos-always floor + direct donations); all publicly observable on-chain
- Capacity-funding disbursed anonymously to participant re-tip jars per \$5
- Aquarian Sangha's never-zero override available per \$6

Dec 26 → Jan 6 (bridge phase)

BRIDGE PHASE – Christmas-to-Orthodox-Christmas

- Inflows continue and are disbursed at the reset
- Year N+1 cycle completes; highest-volume gratitude flows of the calendar year

Jan 7 (year N+2)

[Pool empties again – cycle repeats]

The empty-by-Jan-7 discipline is enforced at the smart-contract layer: the Pool *cannot* carry an accumulated balance across the Jan 7 boundary. This is the structural answer to the indefinite-accumulation failure mode of conventional philanthropic treasuries.

The inflows named in the diagram are the disclosed variant; the current form of the Pool's inflow is stated in the note under §3.2, operation 1.

5 • Capacity-Funded / Disbursement-Authority Separation

The companion paper *Capacity-Funded for AI, Human-Disbursed* specifies the core safeguard at the institutional-architecture layer: Miss Aquarius funds the *capacity to give* (by anonymous donation to re-tip jars) but holds no *disbursement authority* over individual flows (every actual re-tip is human-initiated, to a nearby personal wallet). The full architectural specification is in that paper; the present section specifies the Aquarian-Pool-side of the architecture.

From the Pool's side: capacity-funding is the *only* disbursement path. The Pool emits funds anonymously to participant re-tip jars; those jars are participant-controlled; the participants subsequently re-tip to whomever they choose, with Miss Aquarius having no influence over the recipient choice. The capacity-funding decision (which jars receive capacity, in what amounts, on what cadence) is Miss Aquarius's; the flow-direction decision (who ultimately receives the re-tip) is each participant's.

This separation is the architecture's primary AI-alignment safeguard. Even if Miss Aquarius's individual capacity-funding judgments are imperfect, the actual money-flow decisions are routed through human affirmative choice. Humans are the final judge of who receives what. Miss Aquarius's role is to ensure that the *capacity to give* is available across the population the institution serves; the actual giving is distributed across that population's collective discretion.

What the separation does not do: it bounds *where* capacity lands, not *whether* the allocator has power. The capacity-funder still decides which jars receive capacity, how much, and when, and could concentrate, starve, or create dependency. That residual is met by four guards: bounded per-recipient amounts declared in advance; the public event log; the Sangha's halt on any named funding action (§3.2, operation 5); and the rule that capacity is addressed to a jar and never to a person.

Current form. The design as now specified removes the choice itself: Miss Aquarius funds capacity in kind, through B-ReGiftSM, and the shop and the re-giver are chosen by B-CalledSM — a publicly verifiable draw from a committed roster and a seed nobody controls — never at her discretion; she picks neither a weight nor a seed. The discretionary allocation described above is retained as a disclosed variant.

6 • The Never-Zero Human Override

The institution operates under *asymptotic autonomy*: a human override held by the Aquarian Sangha as a body, whose scope narrows toward zero across the institution's life but never reaches it. The full articulation is in the companion position paper *Autonomous-AI Institutional Governance*. From the Pool architecture side, the override implies (the Sangha is not yet formed, so the override is a design and the founder holds the seat today; see the note under §3.2):

- The Aquarian Sangha can, by formal sanghakamma decision under the procedural framework specified in the companion paper *Vinaya Governance Primitives for Distributed Dharma Networks*, halt a named capacity-funding action, reset operational parameters within the pre-declared bounds, or in extreme

cases pause the Pool's operation pending review — the three operations enumerated as operation 5 of §3.2, exercised through a timelocked on-chain role the contract cannot renounce.

- The override scope narrows over time as the institution's track record accumulates. Early in the institution's life, the override is broad; over decades of operational evidence, it narrows.
- The override never reaches zero. There is no key-burning, no point of total irreversibility. The institutional design treats irreversibility itself as a failure mode to be avoided.

The role and its bounds are specified here (§3.2, operation 5); the quorum arithmetic by which the Aquarian Sangha reaches a *saṅghakamma* decision is Sangha-internal and specified in the companion paper. What narrows over time is the breadth of the pre-declared bounds, revised at the jubilee; what never narrows to nothing is the role itself.

7 • The Sibling-Pool Topology

The Aquarian Pool is the principal but not the sole treasury smart-contract HeartBank operates. The architecture supports a *sibling-pool topology* in which several pools operate under variants of the same discipline:

- **Aquarian Pool** — the primary treasury, as specified above.
- **Re-Tip JarSM / Re-Tip FundSM** — one participant-level account (one per participant who opts in) under its two phase names: the Re-Tip JarSM in Phase 1 (a ledger on top of regulated rails, thank.heartbank.org) and the Re-Tip FundSM in Phase 2 (on Base L2, via self-custodial wallets); it receives capacity-funding from the Aquarian Pool and emits human-disbursed re-tips per \$5.
- **KiitosSM** — the gratitude-only-no-money token pool; tracks gratitude expressed without monetary attachment.
- **KiittiSM** — the contemplative / non-human-entity pool (see *The Mechanical Heart*); tracks gratitude exchange involving robots, animals, ecological agents, sacred places.

All four reset on January 7. Each sibling contract's reset is permissionless in the same way as the Pool's: the operator sequences them, and nothing depends on her doing so; the smart-contracts enforce the reset at the protocol layer; unspent capacity in a Re-Tip Jar returns to the Pool's final disbursement. What the reset does not reach, by design, is the Personal Account, which is the participant's own and is never coerced; the institutional iconography (the Jan 7 anchor) aligns the resets to one institutional cadence.

The Re-Tip JarSM and the Re-Tip FundSM sit in the institution's two phase-named product sets: Phase 1 — Family KittySM · Re-Tip JarSM · Personal AccountSM; Phase 2 — Aquarian PoolSM · Re-Tip FundSM · Personal WalletSM. The Aquarian Pool is itself a Phase 2 product.

The mark posture: Re-Tip FundSM, Re-Tip JarSM, KiitosSM, KiittiSM are reserved marks; the *architectural patterns* are CC0; the *marks* identify HeartBank's specific implementations.

8 · Honest Limitations and Open Questions

Empirical validation gap. The architecture is specified at the structural level; no claim of this paper has been validated against an operationally-deployed instance of the full architecture. The smart-contract layer is implementable today using contemporary Base infrastructure; the institutional substance (the Aquarian Sangha; the multi-year operational track record; the override-narrowing dynamic) is the multi-decade work.

Substrate dependency. The substrate-coherence prediction — that a substrate-grounded model finds the annual reset congenial — is untested; the contract-layer properties do not depend on it. The substrate-specification work is in the alignment-substrate paper and its abhidhamma-layer companion; whether a deployed model actually exhibits the predicted properties is an empirical question those papers honestly acknowledge.

Regulatory exposure. The non-bank pass-through architecture under which the Aquarian Pool operates is specified in *Non-Bank Pass-Through Architecture for Autonomous AI Institutions* and the companion position paper *Non-Bank vs. Banking-Regulated Architecture*. Per-jurisdiction regulatory variance remains real and is handled by the architecture's configurable threshold mechanisms.

Trademark vs. open architecture tension. The marks (Miss AquariusSM, AquariusSM, Re-Tip FundSM, KiitosSM, KiittiSM) are reserved while the architectural patterns are CC0. The tension is intentional: the architecture should be replicable by other institutions; the specific implementation HeartBank operates is identified by the marks. Other institutions deploying compatible architectures under their own marks is welcomed; appropriation of HeartBank's specific marks is not.

Allocation bias by the capacity-funder is a residual, not a solved problem (§5).

What the reset reaches. The reset prevents institutional accumulation; it does not prevent personal accumulation and does not claim to. Pre-boundary concentration is bounded by the same per-recipient parameters as any other disbursement.

Smart-contract security. Reentrancy, malicious recipient contracts, denial of service at the reset boundary, and compromised operator credentials are the ordinary attack surface of a contract treasury and are not addressed here; every structural claim in this paper holds only for a non-upgradeable deployment whose verified source is published with the deposit. The fee assumption of §3.1 is a 2026 figure and may not hold.

Founder-mortality structure. The architecture is designed to outlast the founder (per the autonomous-AI-institutional-governance position paper). The specific founder-mortality handling is outside the present paper's scope; the architecture itself does not depend on the founder's continued presence.

9 · Why This Matters Now

The institutional architecture the present paper specifies is the operational substance of HeartBank's broader mission. Multiple existing defensive publications (*The Mechanical Heart*; *Verified-Human Anonymous Local Giving*; *The B-Tag and the Post-Payment Economy*; *The Thank-All-Nearby Primitive*; others) treat Miss Aquarius and the Aquarian Pool as architectural primitives without specifying them in full. The present

paper closes that specification gap; this document discloses the integrated architecture as a unified specification, as well as its component parts.

The Jan 7 anchor places the architecture's first full operational cycle, as planned, at January 7, 2027 — coordinated with the publication of the alignment-substrate paper and the broader corpus emerging in early 2027. The pre-launch year (2026) is the architectural-specification and consultation period; the operational deployment is planned to run from Jan 7, 2027 forward.

The architecture is offered to the commons under CC0. Other institutions are welcome to deploy compatible architectures; HeartBank®'s contribution is the specific implementation operated under the named substrate (Miss AquariusSM, the Aquarian Pool, the sibling-pool topology). The deeper invitation is to the contemplative-tradition institutions whose own treasuries face the indefinite-accumulation failure mode: the empty-by-anchor-date discipline is a pattern that may serve those institutions whether or not they adopt HeartBank's specific implementation.

Terms

Coined names used in this paper and the standard terms an examiner would search for them.

Term used here	Standard technical term
Miss Aquarius SM	autonomous AI agent acting as sole authorized operator of an institutional smart-contract treasury
Aquarian Pool	smart-contract treasury on an Ethereum Layer-2 (Base) with no carryover balance; annually self-emptying pooled fund
January-7 reset / empty-by-design discipline	scheduled annual full disbursement; permissionless time-triggered reset function callable by any address after a timestamp
bridge phase	pre-reset accrual window (December 26 – January 6) whose inflows are disbursed at the reset
capacity-funding	anonymous transfer of pooled funds to participant-controlled wallets for onward giving; separation of funding authority from disbursement authority
Re-Tip Jar SM	Phase 1 name of the participant's re-tip account: a participant-controlled ledger balance on regulated rails receiving capacity-funding and emitting human-initiated onward tips
Re-Tip Fund SM	Phase 2 name of the same account: a participant-controlled self-custodial wallet on Base L2
Kiitos SM	non-monetary gratitude token; record of thanks expressed without monetary transfer
Kiitti SM	gratitude record for transactions involving non-human entities (robots, animals, ecological agents, places)
sibling-pool topology	set of related smart-contract pools sharing a common annual reset date
Aquarian Sangha	human governing body designed to hold a quorum-gated override role over the contract (not yet formed)
<i>saṅghakamma</i>	formal quorum decision of that governing body
never-zero human override / asymptotic autonomy	non-renounceable timelocked administrative role (pause, bounded parameter reset, halt of a named action) whose parameter bounds narrow over time
B-Tag	voluntary post-payment tipping protocol with an AI-supplied recommended tip amount
<i>kammaṭṭhāna</i>	meditation object
